Report of Q.A.M.A. Meeting at Lake Placid
October 7th - 10th

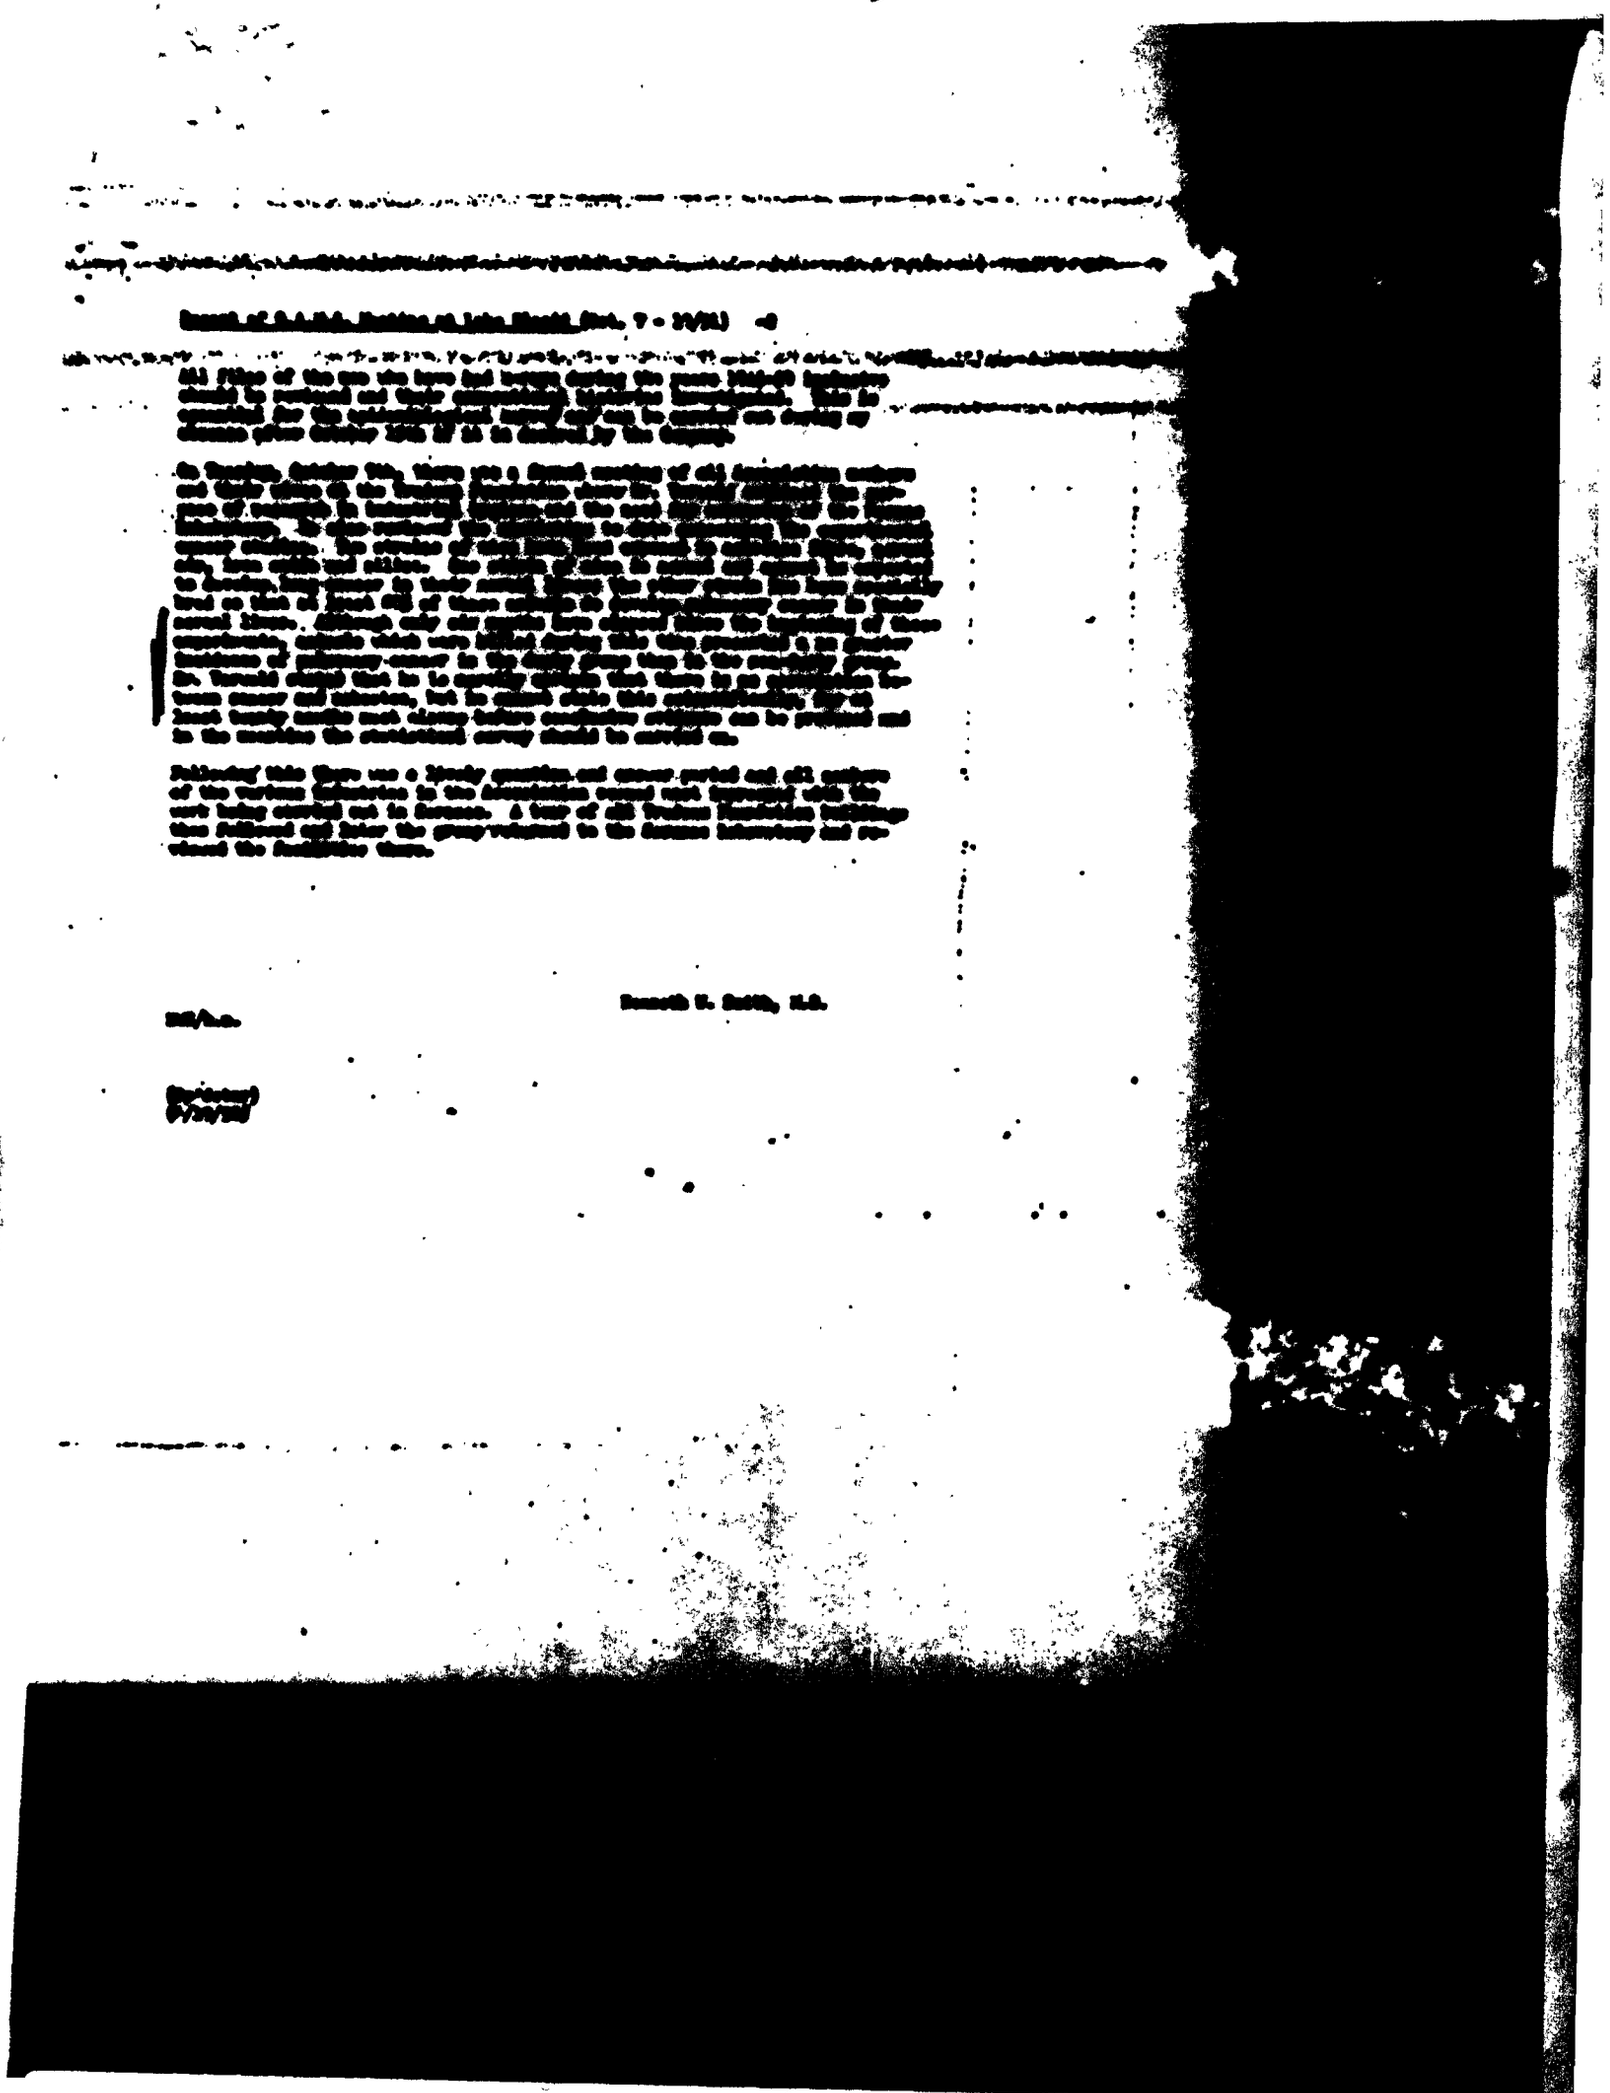

Early Sunday morning, October 7th, I entered to Dorset Inn and spent the afternoon and evening with Dr. George Wright reviewing the results of the physical examinations which he carried out on our men during the past three years. I was given a report on each individual and was told how to discuss this with each of them. Plans also were made for Dr. Wright to request re-examination of certain of these men at various intervals during the next ten years, so that their work histories may be correlated with continued exposure to asbestos dust.

The research progress were discussed. One [redacted] project, would be for Dr. Wright to establish a [redacted] with a slightly different procedure and required examinations [redacted]

The other research project is to study the effect of cortisone on pulmonary fibrosis. It is recommended that this should be carried out at the Saranac Laboratory this subject was discussed some time ago and was turned down [redacted]

On Monday Dr. Cartier and I reviewed the cancer research program with Dr. Terracini. During the period under this year I examined 3,241 lung films of these there were 247 cases of healed tuberculosis on the apex [illegible] lung films there were 10 cases of active tuberculosis on the [illegible] lung films also there were 43 cases of arteriosclerosis there were no cases of malignant tumor of cancer. Dr. Cartier reported on 1,770 cases in which he has found 9 cases of cancer, but when these cases were reviewed there is only one of [illegible] cases with schoolmate. A further study must be carried out for the educational survey.
