Dear Hugh:

We have completed our examination of the series of chest roentgenograms from the Billerica Plant and are enclosing the usual essay report and the classification recently devised by the Cincinnati-U.I.C.C. Committee. If any questions arise in your mind pertaining to these reports I will be glad to discuss them with you.

In general, the quality of the roentgenograms was satisfactory. I was surprised to find that the amount of time needed to complete this series was considerably longer than I had anticipated. Perhaps one reason for this was the unforeseen relatively large number of abnormalities.

We are now awaiting the arrival of the films from Manville, New Jersey.

With kindest personal regards,

Sincerely yours,

Leonard J. Bristol, M.D.
Director, Silicosis Control Unit
