HARRY COPELAND

Paul Scheuerle - Berlin

Attached is a letter from Dr. Higgins of the University of Michigan who has reviewed Harry Copeland's films. I believe his letter is self-explanatory.

It would appear that the patient's condition has not worsened appreciably over the past several years.

Although the levels of fibrous asbestos in the plant have not been excessively high, there is always the possibility of individual susceptibility to consider. Dr. Paisley apparently considers this a case of asbestosis. He has reviewed not only the films but the individual in question.

From a medical standpoint, it would seem reasonable that this case should be accepted as asbestosis.

If you have any questions or comments please let me know.
