Dear Frank:

As you know we have been trying to keep close to the asbestos toxicology work in the U.K. Fred Mumpton at Niagara Falls arranged for some work to be carried out on a sample and gave us a report on this. Ian Sayers took the report to the laboratory group in the U.K. which is co-ordinating this work. I am enclosing a copy of his hand written report for your information. When they come back to us for additional analytical work we will pass it on to you. There continues to be a great amount of concern about this subject and we are going to have to learn to live with the problem in the U.K. So far there has been no indication of it being passed on to the continent. OVER

In this report Ian passes on the request for permission to publish our data and I would like your comments on this. Even if you agree we would try to find out in more detail the conditions under which this data would be presented before agreeing directly with them. Perhaps it would be better to have this sort of publication first approved by Carl Dernehl before we finally agree. Also I will ask Ian to follow directly on obtaining the spectrographic analysis method.

If you or any of the others receiving this letter have any comments I would welcome them.

Best regards,

A 1793C

Very truly yours,

THOMAS J. HALL.

Encl

This is a good deal of background information which is not familiar to me but is implied here. Suggest we should take matters in hand when Ian is back & get this line.

SUMMARY ON SAYER'S REPORT OF VISIT TO PNEUMOCONIOSIS RESEARCH UNIT 7.11.67

GAVE DR. TIMBRELL MUMPTON'S ANALYTICAL DATA.

PRU NOW SAYS THAT CHRYSOTILE FIBERS, BEING CURVED, ARE LESS LIKELY TO GO DEEP INTO LUNGS. INJECTED CHRYSOTILE DOES CAUSE CANCER IN RATS, SO THE FACT THAT IN PRACTICE IT IS LESS RESPONSIBLE FOR TUMOR PRODUCTI IS PROBABLY DUE TO ITS GREATER ELIMINATION RATE AS WELL AS ITS GEOMET

Dear Tom:

Enclosed are the several reports on Asbestos Toxicology you lent me. I have copied most of them, and would appreicate it if you could send me copies of any new ones which may be issued.

Yours very truly,

J.A. Riddle

Doctors Puzzled By Cancer Among Asbestos Workers

From The Washington Post

WASHINGTON — A fatal cancer of the chest and abdominal cavities is cropping up among the nation's asbestos workers.

It's rare that 25 years ago it wasn't even in the medical textbooks. The cancer is called mesothelioma, and seems almost peculiar to people exposed to asbestos.

Ironically, those stricken with the deadly disease include a nurse whose father worked in an asbestos plant and a man who handled asbestos for no more than a month while he insulated the plumbing in his own house.

Mesothelioma was first spotlighted in 1960, when a South African doctor found 33 cases among the people living and working in the Cape of Good Hope asbestos fields. Alerted to the problem, this same doctor turned up 57 more cases in the next two years.

Nobody knows how many Americans have had mesothelioma. Even today doctors have [illegible] it — whether they're trying to diagnose it in a person still alive or pin it down at an autopsy.

In three separate studies in the last three years, doctors in three states have turned up 71 cases. Oddly, 11 of them appeared to have had no real exposure to asbestos. The other 60 could all be traced to asbestos contact, either because they worked with it, lived with people who did or lived in neighborhoods where the air was heavily laden with asbestos dust.

The first American study was made in 1964 by Dr. Irving J. Selikoff of New York's Mount Sinai Hospital, who began the study to see if cancer in any way affected the lives of the asbestos insulation workers in the New York metropolitan area.

Tracing the lives of 632 members of the Asbestos Workers Union who were on the union rolls before Jan. 1, 1943, Dr. Selikoff found that 255 of them had died by Jan. 1, 1963.

Some of what he found did not surprise him — that 13 of the 255 died of asbestosis, a long-known but decreasingly fatal (due to antibiotics) disease brought on by years of breathing asbestos dust.

Dr. Selikoff also found that 45 of the men had died of lung cancer, a rate 6.6 times higher than that in the normal adult male population. Even more surprising, he found five deaths due to mesothelioma. "This incidence of more than 1 per cent," said Dr. Selikoff, "is strikingly high for a tumor which is generally considered to be extremely rare."

Dr. Selikoff then launched a follow-on study of 307 consecutive deaths among asbestos insulation workers throughout the whole Northeast. Again, to his surprise, he turned up 10 deaths due to mesothelioma.

About the same time, the Pennsylvania State Department of Health began a blind study to find how mesothelioma might be affecting the more than 5,000 asbestos workers scattered about the state.

To 163 hospitals in the southeastern part of the state they sent a questionnaire, asking the hospitals to report all mesotheliomas diagnosed between 1954 and 1963.

Back came 42 documented cases of the disease, only 11 of which could not be traced to asbestos exposure.

Ten victims of the disease turned out to be men who worked in asbestos plants. Eight were people who lived near asbestos plants most of their lives. Three were members of families who had one or more asbestos worker members — a 3-year-old girl whose father was an asbestos engineer, a nurse whose father had worked for 35 years in an asbestos plant and a woman with two sons who worked as asbestos insulators in a shipyard.

Of 10 deaths which seemed "questionable" asbestos exposures, two turned out to be almost bizarre. One was a Swiss cheesemaker, who worked almost his entire life around a large boiler covered with asbestos insulation that flaked off at the touch. Another was a worker in a brewery, where it turned out that beer is filtered through pulp filters made essentially of cotton fiber and asbestos.

The most convincing study is the most recent one — conducted by a team of doctors working out of Middlesex General Hospital in New Brunswick, N.J., a few miles from the nation's largest asbestos plant, one that employs 5,800 workers.

In the past three years, no fewer than 19 cases of mesothelioma passed through Middlesex General—only two of the 19 were not workers at the nearby asbestos plant, one a woman who apparently inhaled asbestos dust in laundering her husband's work clothes, the second a spinster who lived one block from the plant.

A relatively "new" disease, mesothelioma is also one of the most difficult diseases to confront modern medicine.

It is almost impossible to treat. Middlesex General's Dr. Maxwell Borow says that even the most potent anti - cancer drugs have no effect on it. About all that radiation treatments do, he says, is remove some of the fluid that builds up in the lungs from the disease.

"The disease is 100 per cent fatal," Dr. Borow states, "and usually takes less than a year after diagnosis to run its course."

Nobody knows why it attacks some asbestos workers and not others. The University of Michigan School of Medicine cites a case of a man who was exposed to asbestos for about a month while he insulated his house. Six years later, he was dead of mesothelioma.

NOTES ON THE NEWS

OH, MY ACHING BACK

Nagging backache, headache and many other aches and pains may come on with over-exertion, emotional upsets or everyday stress and strain. If this nagging backache, with tension, sleepless nights, is wearing you out, making you miserable and irritable, don't wait, try Doan's Pills — an analgesic, a pain reliever. Doan's pain-relieving action on nagging backache is often the answer. Get Doan's Pills — not a habit-forming drug but a well-known standard remedy used successfully by millions for over 70 years. See if they don't bring you the same welcome relief. For overtension, always buy Doan's large size.
