IMPROVE QUALITY...CUT COSTS
WITH UNION CARBIDE'S HIGH-PURITY ASBESTOS

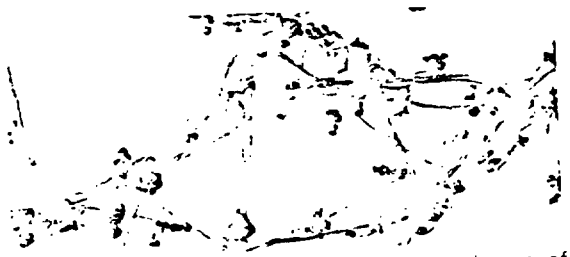

UNION CARBIDE ASBESTOS

IS:

* Grit free
* Higher in brightness and surface area
* Instantly dispersible

HERE'S WHAT IT CAN DO FOR YOUR PAPER

* Superior TiO_2 Retention

Greatly improved by the high surface charge of the fiber as shown in the photomicrograph.

* Positive Pitch Control—because of the high-surface area and absorptivity of Union Carbide's fiber.
* Opacity, Printability, and Sheet Formation—all improved by greater retention and more uniform dispersion of all fines.
* Softness—Union Carbide's high-purity asbestos softens tower and tissue stock by simple addition of fiber—gives excellent hand feel.

AND IT'S AVAILABLE:

Union Carbide owns and mines an extensive deposit of short fiber (chrysotile) asbestos in the New Idria district of California. A modern mill, incorporating a unique process, produces a short-fiber asbestos product which is purer than any other commercially available. During the processing cycle, each individual chrysotile fibril is fully liberated from the surrounding fibrils and entrapped impurities.
