Read your letter re Taft industrial hygiene situation with interest. It appears to be a thorough job. I question one statement. On page 4 under the oleflin unit you mention "Kaylo asbestos". It is my understanding that the KAYLO insulation is basically calcium silicate; I didn't know that it contained asbestos, although to the eye it looks very much like asbestos. As you know, KAYLO is a trade name, but I don't recall the manufacturer.

Dear Bob:

I appreciate your comments on the Zapp industrial hygiene report.

You were correct in that Kaylo insulation is basically calcium silicate. However, according to the manufacturer's brochure, the silicate is reinforced with asbestos fibers.

Carey Temp, which contains no asbestos, I agree looks very similar. In fact, I have not learned to discern the difference. It is my practice to inquire of the insulator the brand name he is using. Often the label original carton is used to transport the material to the sight of application.

Enclosed is a copy of the manufacturer's brochure, should you wish to retain it for reference.

Regards,
Ron Deese
