Subject Monitoring for Asbestos Exposure Potential - 511 Construction Gasket Shop

Two personal and two area samples have been collected in the Construction Gasket Shop as a measure of airborne asbestos. By observation, it would appear that the degree of asbestos fibers becoming airborne at this location would be minimal. Sampling was performed while the gasket cutting machine and the cutting shears were being used as a check of each job task.

Samples have been submitted to your group, together with two similar samples from the Plant 512 gasket shop, for fiber count.
