MEMORANDUM TO: R. E. Crum, C. A. McNeill, K. B. Purintan, W. V. Summers, G. W. Wulfert

FROM: T. L. Grittie

DATE: February 26, 1986.

SUBJECT: Results of Qualitative Analysis Of Lint From Vogue-Swift

COPY TO: D. A. Boggs

Attached, please find the results of the qualitative analysis for asbestos performed on the samples of lint removed from the Vogue-Swift washing machines. Please note that a small amount of asbestos was indeed found.

This information leads me to recommend that we continue to provide laundering services to the insulators when they are working with asbestos. This service provides the vital function of preventing a man from possibly contaminating his family by carrying asbestos home on his clothing. In addition, laundry bags containing these clothes should continue to be labelled as asbestos contaminated so as to provide adequate warning to the employees of Vogue-Swift.

If you have any questions on the results or recommendations, feel free to call me at 521.

Sincerely,

T. L. Grittie

Subject Asbestos Content -- Sample 5610696

To Sarah Vandenberg Location Williamstown

From Ron Huttie Location Huntington

Analyses was performed using polarized light microscopy in accordance with EPA (Environmental Protection Agency) methods. Since the sample consisted of fragments of many different bulk materials; a qualitative analyses was performed. (A quantitative percentage for each component is not given). The results list the types of fibrous and nonfibrous components present in the sample.
