Dear Rusty:

I am enclosing the 1979 results of the sputum cytology tests. Table I breaks the results down into age groups and into the smoking and non-smoking catagories. I have also shown the employees in these catagories that have greater or less than ten years of service. As in the past, the results are much better than that predicted by Dr. Saccomanno's data. However, when comparing the data for those greater and less than ten years of service there may be some information worth further consideration. We are showing no moderate atypicals in either catagory. However, there is a marked increase in the mild atypicals in both the smokers and non-smokers with over ten years of service. Table II shows the results comparing the greater than and less than ten year exposures for all employees and for only employees over 30 years of age (all the greater than ten year exposed employees are over 30). If, you would like further details on this data, I would be glad to supply them.

Very truly yours,

W B D Atley
