MEMO TO FILE

Subject: Exposure to asbestos in changing the filters and cleaning operations at Building 122.

There have been complaints by E. C. Swiedom that this clean up was not in compliance with OSHA. Investigation through Ken Ross and C. W. Perry indicates that sample in June, 1974, showed less than 1 fiber per cc for the operator and also for the janitor who used "oil wipe" method of cleaning. We would consider this to be a wet method in the context of the OSHA standard. Work practice has the operator wearing a dust mask respirator and handling the asbestos additive with care. The only area of non-compliance is that at present the sweepings are not bagged, labeled, and properly disposed of. I am assured that this will be implemented in the future.
