TO OUR EMPLOYEES

Through your Union and the manufacturers, considerable money is being expended for research to determine the effects of asbestos fiber on people.

We know that good accident prevention practice is to minimize the amount of dust inhaled—no matter what the origin.

Johns-Manville has provided you with a Bureau of Mines approved respirator made for this purpose. We recommend you use it when working in dusty areas. Remember, the filters should be cleaned daily. They are available from your foreman.

We ask your cooperation in our efforts to operate clean jobs by disposing of scrap in the plastic container provided. Also by only using fabrication equipment adequately provided with dust collection equipment either in a fab shop or on the jobsite.

We will provide safety equipment on every job to protect your health. We must insist on your cooperation by following prescribed health and safety precautions.
